EXPERIMENT-1 & 2

Name: Aartee chimate
UID:2018140012
Branch:IT
Sub: CSS

AIM: To implement Substitution, ROT13, Transposition, Double Transposition, Vernam cipher, and Diffie Hellman in python.

CODE:

```
import string

def SubCypher():

    # A list containing all characters
    all_letters= string.ascii_letters

    """
    create a dictionary to store the substitution
    for the given alphabet in the plain text
    based on the key
    """

    dict1 = {}

    plain_txt= input("Enter Plain text to be encrypted:  ")
    key = int(input("Enter no. of position shifts:  "))

    for i in range(len(all_letters)):
        dict1[all_letters[i]] = all_letters[(i+key)%len(all_letters)]

    cipher_txt=[]

    # loop to generate ciphertext

    for char in plain_txt:
        if char in all_letters:
```

```
            temp = dict1[char]
            cipher_txt.append(temp)
        else:
            temp =char
            cipher_txt.append(temp)

    cipher_txt= "".join(cipher_txt)
    print("Encrypted Message:  ",cipher_txt)

    #create a dictionary to store the substitution
    #for the given alphabet in the cipher
    #text based on the key

    dict2 = {}
    for i in range(len(all_letters)):
        dict2[all_letters[i]] = all_letters[(i-key)%(len(all_letters))]

    # loop to recover plain text
    decrypt_txt = []

    for char in cipher_txt:
        if char in all_letters:
            temp = dict2[char]
            decrypt_txt.append(temp)
        else:
            temp = char
            decrypt_txt.append(temp)

    decrypt_txt = "".join(decrypt_txt)
    print("Decrypted Message:  ", decrypt_txt)

def ROT13():

    # Dictionary to lookup the index of alphabets
    dict1 = {'A' : 1, 'B' : 2, 'C' : 3, 'D' : 4, 'E' : 5,
            'F' : 6, 'G' : 7, 'H' : 8, 'I' : 9, 'J' : 10,

Conclusion:

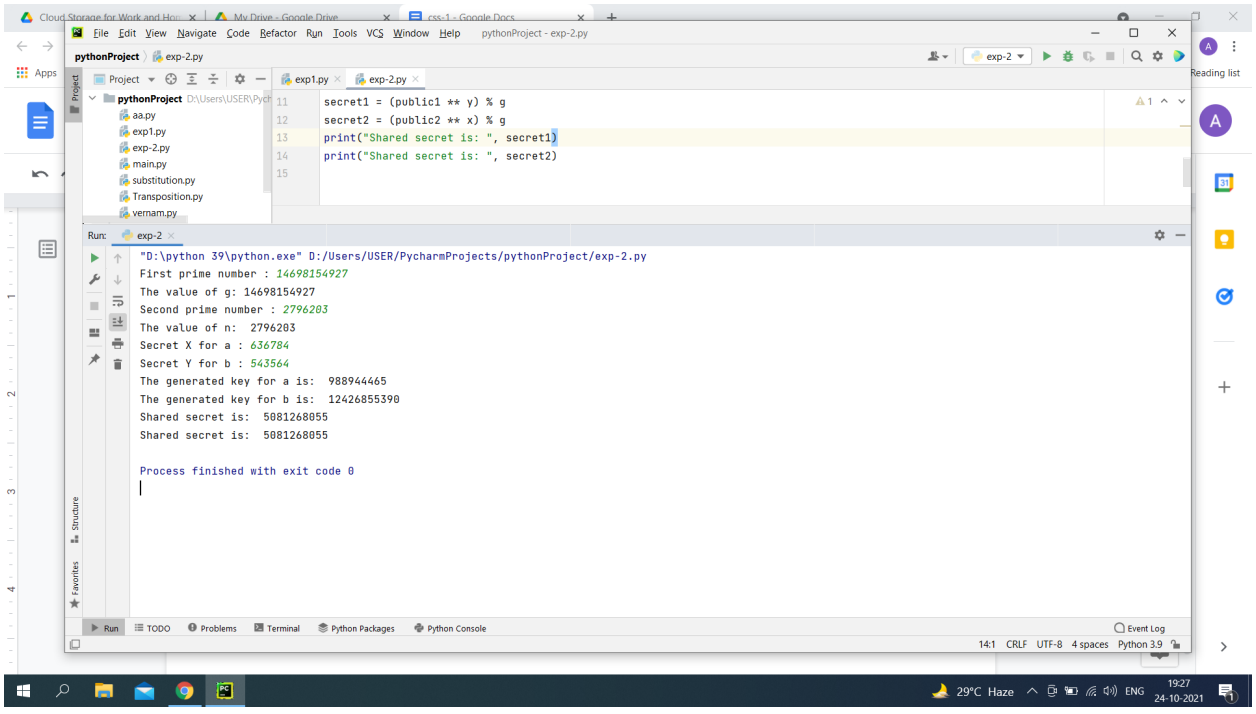
1. In the substitution algorithm and ROT 13 algorithm , I had to make sure that while shifting the ASCII values of the characters, the final ordinal value of every character does not exceed the total number of available characters. I solved this problem by utilizing the modulo operation and applied it while encrypting as well as decrypting a given string.
2. A transposition cipher does not substitute one symbol for another, instead it changes the location of the symbol. A symbol in the first position of the plaintext may appear in the tenth position of the ciphertext. A symbol in the eight position in the plaintext may appear in the first position of the ciphertext. Basically, a transposition cipher reorders (transpose) the symbols.
3. Double transposition designates the letters in the original plaintext message by the numbers designating their position. First the plaintext is written into an array of a given size and then permutation of rows and columns is done according to the specified permutations.
4. The key is exactly the same as the length of the message which is encrypted for vernam cipher.. The key is made up of random symbols. The key is used one time only and never used again for any other message to be encrypted.The vernam cipher is an unbreakable symmetric encryption technique. The key is unbreakable because it is as long as the given message.

Diffie Hellman:

CODE:

```
g = int(input("First prime number : "))
print("The value of g:", g)
n = int(input("Second prime number : "))
print("The value of n: ",n)
x = int(input("Secret X for a : "))
y = int(input("Secret Y for b : "))
public1 = (n ** x) % g
public2 = (n ** y) % g
print("The generated key for a is: ", public1)
print("The generated key for b is: ", public2)
secret1 = (public1 ** y) % g
secret2 = (public2 ** x) % g
print("Shared secret is: ", secret1)
print("Shared secret is: ", secret2)
```

OUTPUT:



Conclusion:

1. Diffie Hellman algorithm generating a symmetric key on a public network. This algorithm makes use of the primitive root of any prime numbers that are given by the user.This algorithm enables two parties communicating over a public channel to establish a mutual secret without it being transmitted over the internet.I found that as long as it is implemented alongside an appropriate authentication method and the numbers have been selected properly, it is not considered vulnerable to attack.
